CAMERA-PRINTER SYSTEM

5

ABSTRACT OF THE DISCLOSURE

A camera-printer system comprises a still video camera provided with a release switch, and a printer provided with a print start switch. The still video camera and the printer are connected to each other. By depressing either the release switch or the print start switch once, a photographing operation is started in the still video camera. By depressing either the release switch or the print start switch again, or by initially depressing the release switch or the print start switch continuously for more than a predetermined period, a printing operation of the printer is automatically started after the photographing operation of the still video camera.
